# Price Is Right

Keegan Wilson, Rachel Abraham, Zahra Najib

# What was our project idea?

1. We decided to design our version of the Price Is Right.
2. We used php and html to have the user enter a guess for an item, they have two tries until they are taken back to the first level or to the previous level.
3. We also utilized tools like sessions, form processing, and scrum framework to make our project come live.

# How Scrum benefited us?

1. We took a day or two to brainstorm this idea.
2. We scheduled two three day sprints and decided to meet at 10pm every night to discuss about any challenges and progress we made.
3. I assigned tasks to every team member and checked up on their progress every stand up.
4. We set priority tasks and features we wanted to roll out based on the deadline.

# Demo

Code is explained via demo instead of being on slides.
